

Convergence of Sequences of Random Variables

- Definitions

★ $X_n \xrightarrow{a.s.} X$ means $P\{s : \lim_{n \rightarrow \infty} X(s) = X(s)\} = 1$.

★ $X_n \xrightarrow{P} X$ means $\forall \epsilon > 0, \lim_{n \rightarrow \infty} P\{|X_n - X| < \epsilon\} = 1$.

★ $X_n \xrightarrow{d} X$ means for every continuity point x of F_X , $\lim_{n \rightarrow \infty} F_{X_n}(x) = F_X(x)$.

- $X_n \xrightarrow{a.s.} X$ if and only if $\forall \epsilon > 0, \lim_{n \rightarrow \infty} P(\cap_{k=n}^{\infty} \{|X_k - X| < \epsilon\}) = 1$.

- $X_n \xrightarrow{a.s.} X \Rightarrow X_n \xrightarrow{P} X \Rightarrow X_n \xrightarrow{d} X$.

- If a is a constant, $X_n \xrightarrow{d} a \Rightarrow X_n \xrightarrow{P} a$.

- If $\lim_{n \rightarrow \infty} f_{X_n}(x) = f_X(x)$ for each x , $X_n \xrightarrow{d} X$.

- Let \mathbf{X} and \mathbf{X}_n be random vectors in \mathbb{R}^k . $\mathbf{X}_n \xrightarrow{d} \mathbf{X}$ if and only if $\lim_{n \rightarrow \infty} E[g(\mathbf{X}_n)] = E[g(\mathbf{X})]$ for every bounded continuous function $g : \mathbb{R}^k \rightarrow \mathbb{R}$.

- Slutsky Theorems for Convergence in Distribution:

1. If $\mathbf{X}_n \in \mathbb{R}^m$, $\mathbf{X}_n \xrightarrow{d} \mathbf{X}$ and if $f : \mathbb{R}^m \rightarrow \mathbb{R}^q$ (where $q \leq m$) is continuous except possibly on a set C with $P(\mathbf{X} \in C) = 0$, then $f(\mathbf{X}_n) \xrightarrow{d} f(\mathbf{X})$.

2. If $\mathbf{X}_n \xrightarrow{d} \mathbf{X}$ and $(\mathbf{X}_n - \mathbf{Y}_n) \xrightarrow{P} 0$, then $\mathbf{Y}_n \xrightarrow{d} \mathbf{X}$.

3. If $\mathbf{X}_n \in \mathbb{R}^d$, $\mathbf{Y}_n \in \mathbb{R}^k$, $\mathbf{X}_n \xrightarrow{d} \mathbf{X}$ and $\mathbf{Y}_n \xrightarrow{d} \mathbf{c}$, then

$$\begin{pmatrix} \mathbf{X}_n \\ \mathbf{Y}_n \end{pmatrix} \xrightarrow{d} \begin{pmatrix} \mathbf{X} \\ \mathbf{c} \end{pmatrix}$$

- Slutsky Theorems for Convergence in Probability:

1. If $\mathbf{X}_n \in \mathbb{R}^m$, $\mathbf{X}_n \xrightarrow{P} \mathbf{X}$ and if $f : \mathbb{R}^m \rightarrow \mathbb{R}^q$ (where $q \leq m$) is continuous except possibly on a set C with $P(\mathbf{X} \in C) = 0$, then $f(\mathbf{X}_n) \xrightarrow{P} f(\mathbf{X})$.

2. If $\mathbf{X}_n \xrightarrow{P} \mathbf{X}$ and $(\mathbf{X}_n - \mathbf{Y}_n) \xrightarrow{P} 0$, then $\mathbf{Y}_n \xrightarrow{P} \mathbf{X}$.

3. If $\mathbf{X}_n \in \mathbb{R}^d$, $\mathbf{Y}_n \in \mathbb{R}^k$, $\mathbf{X}_n \xrightarrow{P} \mathbf{X}$ and $\mathbf{Y}_n \xrightarrow{P} \mathbf{Y}$, then

$$\begin{pmatrix} \mathbf{X}_n \\ \mathbf{Y}_n \end{pmatrix} \xrightarrow{P} \begin{pmatrix} \mathbf{X} \\ \mathbf{Y} \end{pmatrix}$$

- Let $g(x)$ have a second derivative that is continuous at $x = \theta$, and let $\sqrt{n}(T_n - \theta) \xrightarrow{d} T$. Then $\sqrt{n}(g(T_n) - g(\theta)) \xrightarrow{d} g'(\theta)T$.
- Strong Law of Large Numbers (SLLN): Let X_1, \dots, X_n be i.i.d. random variables with finite first moment. Then $\bar{X}_n \xrightarrow{a.s.} E(X_1)$.
- Let $\mathbf{X}_1, \dots, \mathbf{X}_n$ be i.i.d. random vectors in \mathbb{R}^k with expected value vector $\boldsymbol{\mu}$ and covariance matrix $\boldsymbol{\Sigma}$. Then $\sqrt{n}(\bar{\mathbf{X}}_n - \boldsymbol{\mu})$ converges in distribution to a multivariate normal with mean $\mathbf{0}$ and covariance matrix $\boldsymbol{\Sigma}$.
- Lindeberg Central Limit Theorem: Consider the triangular array of random variables

$$\begin{array}{c} X_{11} \\ X_{21}, \quad X_{22} \\ X_{31}, \quad X_{32}, \quad X_{33} \\ \dots \end{array}$$

where the random variables in each row are assumed independent with $E(X_{ij}) = 0$ and $Var(X_{ij}) = \sigma_{ij}^2$. Let $S_n = \sum_{j=1}^n X_{nj}$, and let $v_n^2 = Var(S_n) = \sum_{j=1}^n \sigma_{nj}^2$. Then $\frac{S_n}{v_n}$ converges in distribution to a standard normal provided, for all $\epsilon > 0$,

$$\lim_{n \rightarrow \infty} \frac{1}{v_n^2} \sum_{j=1}^n E[X_{nj}^2 I(|X_{nj}| \geq \epsilon v_n)] = 0$$

- $U_n = O_p(V_n)$ means $\forall \epsilon > 0, \exists M = M(\epsilon)$ and $N = N(\epsilon)$ such that if $n > N$, $P\{\frac{U_n}{V_n} \leq M\} - P\{\frac{U_n}{V_n} \leq -M\} > 1 - \epsilon$. Usually, $V_n = n^{-t}$ for some $t > 0$.
