Statistics

- Objective: To draw reasonable conclusions from noisy numerical data
- Entry point: Study relationships between variables

Variables can be

- Independent: Predictor or cause (contributing factor)
- Dependent: Predicted or effect

Simple regression and correlation

- Simple means one IV
- DV quantitative
- IV usually quantitative too

Scatterplot

Least squares line

Correlation coefficient r

- $-1 \leq r \leq 1$
- $r = +1$ indicates a perfect positive linear relationship. All the points are exactly on a line with a positive slope.
- $r = -1$ indicates a perfect negative linear relationship. All the points are exactly on a line with a negative slope.
- $r = 0$ means no *linear* relationship (curve possible). Slope of least squares line = 0
- $r^2 =$ proportion of variation explained

$r = 0.004$

$r = 0.112$

Correlation of C4 and C6 = 0.112

$$r = 0.368$$

Correlation of C3 and C7 = 0.368

$$r = 0.547$$

Correlation of C4 and C7 = 0.547

$$r = 0.733$$

Correlation of C5 and C7 = 0.733

$$r = -0.822$$

$r = 0.025$

Correlation of C1 and C2 = 0.025

$$r = -0.811$$

Correlation of C1 and C2 = -0.811

Why $-1 \leq r \leq 1$?

- $$r = \frac{\sum_{i=1}^n (X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum_{i=1}^n (X_i - \bar{X})^2 \sum_{i=1}^n (Y_i - \bar{Y})^2}}$$

- $$\begin{aligned} \cos(\theta) &= \frac{\mathbf{a}'\mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} \\ &= \frac{\mathbf{a}'\mathbf{b}}{\sqrt{\mathbf{a}'\mathbf{a} \mathbf{b}'\mathbf{b}}} \end{aligned}$$

One Independent Variable at a Time Can Produce Misleading Results

- The standard elementary tests all have a single independent variable, so they should be used with caution in practice.
- Example: Artificial and extreme, to make a point
- Suppose the correlation between Age and Strength is $r = -0.96$

Age and Strength

Need *multiple* regression
