

(1)

STA431/523 Assignment 6

□

$$\text{Corr}(X, W)^2 = \left(\frac{\text{Cov}(X, Y + X + e)}{\sqrt{\text{Var}(X)} \sqrt{\text{Var}(Y + X + e)}} \right)^2$$

$$= \left(\frac{\text{Corr}(X, X + e)}{\sqrt{\text{Var}(X)} \sqrt{\text{Var}(X + e)}} \right)^2 = \text{Reliability without the intercept}$$

$$\begin{aligned} \text{(2)} \quad \text{Corr}(W_1, W_2) &= \text{Corr}(Y_1 + X + e_1, Y_2 + X + e_2) \\ &= \text{Corr}(X + e_1, X + e_2) \quad \text{Intercepts don't matter} \end{aligned}$$

$$\text{(b)} \quad \text{Corr}(W, G)^2 = \left(\frac{\text{Cov}(W, G)}{\sqrt{\text{Var}(W)} \sqrt{\text{Var}(G)}} \right)^2$$

$$= \frac{(\text{Cov}(X + e_1, X + e_2))^2}{(\sigma_x^2 + \sigma_1^2)(\sigma_x^2 + \sigma_2^2)} = \frac{\sigma_x^4 + (\sigma_x^2)^2}{(\sigma_x^2 + \sigma_1^2)(\sigma_x^2 + \sigma_2^2)}$$

$$< \frac{\sigma_x^2}{\sigma_x^2 + \sigma_1^2} \quad \text{Reliability of } W \quad \Leftrightarrow \quad \frac{\sigma_x^2}{\sigma_x^2 + \sigma_2^2} < 1$$

$$\Leftrightarrow \sigma_x^2 < \sigma_1^2 + \sigma_2^2 \quad \Leftrightarrow \sigma_2^2 > 0 \quad \square$$

(4) (a)

$$\begin{aligned}
 (a) \text{Var}(S) &= \text{Var}(W_1 + W_2) = \text{Var}(X + e_1 + X + e_2) \\
 &= \text{Var}(2X + e_1 + e_2) = 4\sigma_x^2 + \sigma_e^2 + \sigma_e^2 \\
 &= 4\sigma_x^2 + 2\sigma_e^2, \text{ so Reliability of } S = W_1 + W_2 \\
 &= \left(\frac{\text{Cov}(X, S)}{\sqrt{\text{Var}(X) \text{Var}(S)}} \right)^2 = \left(\frac{\text{Cov}(X, 2X + e_1 + e_2)}{\sqrt{\sigma_x^2 (4\sigma_x^2 + 2\sigma_e^2)}} \right)^2 \\
 &= \frac{(2\sigma_x^2 + 0)^2}{\sigma_x^2 (4\sigma_x^2 + 2\sigma_e^2)} = \frac{4\sigma_x^2 \sigma_x^2}{(4\sigma_x^2 \sigma_x^2 + 2\sigma_x^2 \sigma_e^2) \frac{1}{4\sigma_x^2}} \\
 &= \frac{\sigma_x^2}{\sigma_x^2 + \frac{1}{2}\sigma_e^2} > \frac{\sigma_x^2}{\sigma_x^2 + \sigma_e^2}
 \end{aligned}$$

$$\begin{aligned}
 (b) S_n &= \sum_{i=1}^n W_i, \text{Var}(S_n) = \text{Var}\left(\sum_{i=1}^n (X + e_i)\right) \\
 &= \text{Var}\left(nX + \sum_{i=1}^n e_i\right) \stackrel{\text{ind}}{=} n^2 \sigma_x^2 + \sum_{i=1}^n \sigma_e^2 \\
 &= n^2 \sigma_x^2 + n \sigma_e^2
 \end{aligned}$$

(4b. continued) Reliability of S

$$\begin{aligned}
&= \text{Corr}(X, S)^2 = \frac{(\text{Cov}(X, \sum_{i=1}^n (X + e_i)))^2}{\sigma_x^2 (n^2 \sigma_x^2 + n \sigma_e^2)} \\
&= \frac{(\text{Cov}(X, nX + \sum_{i=1}^n e_i))^2}{n^2 \sigma_x^2 (\sigma_x^2 + \frac{1}{n} \sigma_e^2)} \\
&= \frac{(n \sigma_x^2 + 0)^2}{n^2 \sigma_x^2 (\sigma_x^2 + \frac{1}{n} \sigma_e^2)} = \frac{\cancel{n^2} \sigma_x^2 \sigma_x^2}{\cancel{n^2} \sigma_x^2 (\sigma_x^2 + \frac{1}{n} \sigma_e^2)}
\end{aligned}$$

(c) Reliability of $\bar{W}_n = \frac{1}{n} \sum_{i=1}^n W_i = \frac{1}{n} S_n$

$$\begin{aligned}
&= \frac{(\text{Cov}(X, \frac{1}{n} S_n))^2}{\text{Var}(X) \text{Var}(\frac{1}{n} S_n)} = \frac{(\frac{1}{n} \text{Cov}(X, S_n))^2}{\frac{1}{n^2} \text{Var}(X) \text{Var}(S_n)}
\end{aligned}$$

$$\begin{aligned}
&= \frac{\cancel{\frac{1}{n^2}} (\text{Cov}(X, S_n))^2}{\cancel{\frac{1}{n^2}} (\sqrt{\text{Var}(X) \text{Var}(S_n)})^2} = \text{Reliability of } S_n
\end{aligned}$$

$$= \frac{\sigma_x^2}{\sigma_x^2 + \frac{1}{n} \sigma_e^2}$$

d) Reliability $\rightarrow 1$ as $n \rightarrow \infty$

Longer tests are more reliable

5 (a)

(b) Reliability is $\frac{\sigma_x^2}{\sigma_x^2 + \sigma_e^2}$

$$\text{Corr}(W_1, W_2) = \frac{\text{cov}(X+e_1, X+e_2)}{\sqrt{\sigma_x^2 + \sigma_e^2} \sqrt{\sigma_x^2 + \sigma_e^2}}$$

$$= \frac{\text{cov}(X, X) + \text{cov}(e_1, e_2)}{\sigma_x^2 + \sigma_e^2} = \frac{\sigma_x^2 + c}{\sigma_x^2 + \sigma_e^2} > \frac{\sigma_x^2}{\sigma_x^2 + \sigma_e^2}$$

because $c > 0$.

6

(b) $\Theta = (\beta_0, \beta_1, \mu_x, \sigma, \omega, \psi)$ 6 parameters

There are 3 σ_i and 2 μ_i for 5 moments

The true model fails the parameter count rule.

(6c)

	x	w
x	σ_x^2	$\beta_1 \sigma_x^2$
w		$\beta_1^2 \sigma_x^2 + \psi + \omega$

$$y = \beta_0 + \beta_1 x + \varepsilon$$

$$w = y + e$$

$$= \beta_0 + \beta_1 x + \varepsilon + e$$

$$\text{Cov}(x, w) = \beta_1 \sigma_x^2$$

(d)

$$\hat{\beta}_1 = \frac{\frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})(w_i - \bar{w})}{\frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})^2} = \frac{\frac{1}{\sigma_x \sigma_w}}{\frac{1}{\sigma_x^2}} \xrightarrow{P} \frac{\sigma_{xw}}{\sigma_x^2}$$

By LLN and continuous mappings,

$$\frac{\sigma_{xw}}{\sigma_x^2} = \frac{\beta_1 \sigma_x^2}{\sigma_x^2} = \beta_1 \text{ consistent, } \textcircled{\text{Yes}}$$

(e) β_1 is identifiable, because otherwise consistent estimation would be impossible

(7) (a) $\theta = (\beta, \sigma, \psi, \omega)$

(b)
$$\Sigma = \begin{matrix} & \omega & \psi \\ \begin{matrix} \omega \\ \psi \end{matrix} & \begin{pmatrix} \sigma + \omega & \beta\sigma \\ \beta\sigma & \beta^2\sigma + \psi \end{pmatrix} \end{matrix}$$

(c) No. There are 4 parameters and three unique moments.

(d) β is identifiable at all (infinitely many) points where $\beta \neq 0$: $\Sigma(\beta, \sigma, \psi, \omega) : \beta \neq 0, \sigma > 0, \psi > 0, \omega > 0$

Because $\beta = 0$ if and only if $\sigma_{12} = 0$

(e) $\hat{\beta}$ cannot be consistent because β is not identifiable in the whole parameter space.

This is correct, but requires proof. Sorry about that!

(7f)

$$\hat{\beta}_n = \frac{\frac{1}{n} \sum_{i=1}^n W_i Y_i}{\frac{1}{n} \sum_{i=1}^n W_i^2} = \frac{\frac{1}{\sigma_{WY}}}{\frac{1}{\sigma_W^2}} \xrightarrow{p} \frac{\sigma_{WY}}{\sigma_W^2}$$

$$= \frac{\beta\sigma}{\sigma + \omega} = \left(\frac{\sigma}{\sigma + \omega} \right) \beta$$

(g) $\hat{\beta}_n \xrightarrow{p} \beta$ where $\beta = 0$. This is exactly where β is identifiable.

(h) Try $\hat{\beta}_n / R_{WYX}^2$. If R_{WYX} is consistent, this estimator will be consistent too, by continuous mapping (and the Slutsky theorem).

8

$$(b) \text{Corr}(D_1, D_2) = \frac{\text{Cov}(D_1, D_2)}{\text{SD}(D_1) \text{SD}(D_2)} = \frac{\text{Cov}(F_1 + e_1, F_2 + e_2)}{\sqrt{(\sigma_{11} + w_1)(\sigma_{22} + w_2)}}$$

$$= \frac{\text{Cov}(F_1, F_2) + 0}{\sqrt{(\sigma_{11} + w_1)(\sigma_{22} + w_2)}} = \frac{\rho_{12}}{\sqrt{(\sigma_{11} + w_1)(\sigma_{22} + w_2)}}$$

And

$$|\text{Corr}(D_1, D_2)| = \frac{|\rho_{12}|}{\sqrt{(\sigma_{11} + w_1)(\sigma_{22} + w_2)}}$$

$$< \frac{|\rho_{12}|}{\sqrt{\sigma_{11} \sigma_{22}}} = |\text{Corr}(F_1, F_2)|$$

Since $w_1 > 0$ and $w_2 > 0$.

$$\begin{aligned}
 (8c) \quad \frac{\text{Cov}(D_1, D_2)}{P_1 P_2} &= \frac{\sigma_{12}}{\sqrt{(\sigma_{11} + w_1)(\sigma_{22} + w_2)}} \\
 &= \frac{\sigma_{12}}{\sqrt{\frac{\sigma_{11}}{\sigma_{11} + w_1}} \sqrt{\frac{\sigma_{22}}{\sigma_{22} + w_2}}} \\
 &= \frac{\sigma_{12}}{\sqrt{\cancel{\sigma_{11} + w_1}} \sqrt{\cancel{\sigma_{22} + w_2}}} \cdot \frac{\sqrt{\cancel{\sigma_{11} + w_1}} \sqrt{\cancel{\sigma_{22} + w_2}}}{\sqrt{\sigma_{11}} \sqrt{\sigma_{22}}} \\
 &= \frac{\sigma_{12}}{\sqrt{\sigma_{11} \sigma_{22}}} = \text{Corr}(F_1, F_2)
 \end{aligned}$$

$$(d) \quad \frac{0.25}{\sqrt{0.90} \sqrt{0.75}} = 0.304$$

(a)
 (9) Dividing numerator and denominator by n^2 ,

$$\hat{\beta}_2 = \frac{\frac{1}{n} \sum_{i=1}^n W_i^2 \frac{1}{n} \sum_{i=1}^n X_{i2} Y_i - \frac{1}{n} \sum_{i=1}^n W_i X_{i2} \frac{1}{n} \sum_{i=1}^n W_i Y_i}{\frac{1}{n} \sum_{i=1}^n W_i^2 \frac{1}{n} \sum_{i=1}^n X_{i2}^2 - \left(\frac{1}{n} \sum_{i=1}^n W_i X_{i2} \right)^2}$$

$$\rightarrow \frac{E(W^2) E(X_2 Y) - E(W X_2) E(W Y)}{E(W^2) E(X_2^2) - (E(W X_2))^2}$$

Need to calculate two expected values.

$$E(W^2) = \text{Var}(W) = \text{Var}(X_1) + \text{Var}(e) = \sigma_{11} + \omega$$

$$E(X_2 Y) = E\{X_2(\beta_1 X_1 + \beta_2 X_2 + \epsilon)\} = \beta_1 E(X_1 X_2) + \beta_2 E(X_2^2) = \beta_1 \sigma_{12} + \beta_2 \sigma_{22}$$

$$E(W X_2) = E\{(X_1 + e) X_2\} = E(X_1 X_2) = \sigma_{12}$$

$$E(W Y) = E\{(X_1 + e)(\beta_1 X_1 + \beta_2 X_2 + \epsilon)\} = \beta_1 E(X_1^2) + \beta_2 E(X_1 X_2) = \beta_1 \sigma_{11} + \beta_2 \sigma_{12}$$

$$E(X_2^2) = \sigma_{22}, \text{ so}$$

$$\begin{aligned} \hat{\beta}_2 &\xrightarrow{P} \frac{(\sigma_{11} + \omega)(\beta_1 \sigma_{12} + \beta_2 \sigma_{22}) - \sigma_{12}(\beta_1 \sigma_{11} + \beta_2 \sigma_{12})}{(\sigma_{11} + \omega)\sigma_{22} - \sigma_{12}^2} \\ &= \frac{\cancel{\sigma_{11} \beta_1 \sigma_{12}} + \sigma_{11} \beta_2 \sigma_{22} + \omega(\beta_1 \sigma_{12} + \beta_2 \sigma_{22}) - \cancel{\sigma_{12} \beta_1 \sigma_{11}} - \sigma_{12}^2 \beta_2}{(\sigma_{11} + \omega)\sigma_{22} - \sigma_{12}^2} \\ &= \frac{\beta_2(\sigma_{11} \sigma_{22} - \sigma_{12}^2) + \omega(\beta_1 \sigma_{12} + \beta_2 \sigma_{22})}{(\sigma_{11} + \omega)\sigma_{22} - \sigma_{12}^2} \end{aligned}$$

(9b) With $w = 0$,

11

$$\frac{\beta_2 (\sigma_{11} \sigma_{22} - \sigma_{12}^2) + w (\beta_1 \sigma_{12} + \beta_2 \sigma_{22})}{(\sigma_{11} + w) \sigma_{22} - \sigma_{12}^2}$$
$$= \frac{\beta_2 (\sigma_{11} \sigma_{22} - \sigma_{12}^2)}{\sigma_{11} \sigma_{22} - \sigma_{12}^2} = \beta_2$$

(c) with $w > 0$ and $\beta_2 = 0$, target is

$$w \beta_1 \sigma_{12}$$

$$\frac{w \beta_1 \sigma_{12}}{(\sigma_{11} + w) \sigma_{22} - \sigma_{12}^2}$$

No. It's only zero when $\beta_1 = 0$, $\sigma_{12} = 0$, or both

(d)

(10)

(b) $\Theta = (\beta, \phi, \psi, w, w_1, w_2)$

(c) There are 6 parameters and $3(3+1)/2 = 6$ covariance structure equations, so yes.

(d)

	w_1	w_2	v
w_1	$\phi + w_1$	ϕ	$\beta\phi$
w_2		$\phi + w_2$	$\beta\phi$
v			$\beta^2\phi + \psi + w$

$$\text{Var}(v) = \text{Var}(Y + e) = \text{Var}(\beta X + \epsilon + e) = \beta^2\phi + \psi + w$$

$$\text{Cov}(w_1, w_2) = \text{Cov}(X + e_1, X + e_2) = \text{Cov}(X, X) + 0 = \phi$$

$$\text{Cov}(w_1, v) = \text{Cov}(X + e_1, \beta X + \epsilon + e) = \beta\phi = \text{Cov}(w_2, v)$$

(e) No. The parameters ψ and w only appear in Σ as $\psi + w$. This means that any two parameter vectors $\Theta = (\beta, \phi, \psi, w, w_1, w_2)$ and

$$\Theta' = (\beta', \phi', \psi', w', w_1', w_2')$$
 with

$\beta = \beta'$, $\phi = \phi'$, $w_1 = w_1'$ and $w_2 = w_2'$ but $\psi \neq \psi'$ & $w \neq w'$ with $\psi + w = \psi' + w'$ will yield the same Σ and the same distribution of the observable data.

(Or you could give a numerical example)

(10f) The identifiable parameters are θ , β , w_1 , and w_2

$$(g) \text{ Set } \hat{\beta}_n = \frac{1}{2} (\hat{\sigma}_{13} + \hat{\sigma}_{23}) / \hat{\sigma}_{12}$$

$$\xrightarrow{p} \frac{1}{2} (\sigma_{13} + \sigma_{23}) / \sigma_{12} \quad \text{by consistency of the sample covariances, the Slutsky theorem and continuous mappings}$$

$$\frac{1}{2} (\beta\theta + \beta\theta) / \theta = \frac{1}{2} 2\beta\theta / \theta = \beta$$

(h) Using answer to (g)

$$\hat{\beta}_n = \frac{1}{2} (19.85 + 19.00) / 21.39 = 0.908$$

(i) Set $c = \psi + w$. Then the parameter vector $(\beta, \theta, c, w_1, w_2)$ is identifiable.
