# More Linear Algebra ${ }^{1}$ STA 302: Fall 2014 

[^0]
## Overview

(1) Things you already know
(2) Spectral decomposition
(3) Positive definite matrices

4 Square root matrices
(5) R

## You already know about

- Matrices $\mathbf{A}=\left[a_{i j}\right]$
- Matrix addition and subtraction $\mathbf{A}+\mathbf{B}=\left[a_{i j}+b_{i j}\right]$
- Scalar multiplication $a \mathbf{B}=\left[a b_{i j}\right]$
- Matrix multiplication $\mathbf{A B}=\left[\sum_{k} a_{i k} b_{k j}\right]$
- Inverse $\mathbf{A}^{-1} \mathbf{A}=\mathbf{A} \mathbf{A}^{-1}=\mathbf{I}$
- Transpose $\mathbf{A}^{\prime}=\left[a_{j i}\right]$
- Symmetric matrices $\mathbf{A}=\mathbf{A}^{\prime}$
- Determinants
- Linear independence

## Linear independence

$\mathbf{X}$ be an $n \times p$ matrix of constants. The columns of $\mathbf{X}$ are said to be linearly dependent if there exists $\mathbf{v} \neq \mathbf{0}$ with $\mathbf{X v}=\mathbf{0}$. We will say that the columns of $\mathbf{X}$ are linearly independent if $\mathbf{X v}=\mathbf{0}$ implies $\mathbf{v}=\mathbf{0}$.

For example, show that $\mathbf{A}^{-1}$ exists implies that the columns of $\mathbf{A}$ are linearly independent.

$$
\mathbf{A} \mathbf{v}=\mathbf{0} \Rightarrow \mathbf{A}^{-1} \mathbf{A} \mathbf{v}=\mathbf{A}^{-1} \mathbf{0} \Rightarrow \mathbf{v}=\mathbf{0}
$$

## How to show $\mathbf{A}^{-1 /}=\mathbf{A}^{\prime-1}$

Suppose $\mathbf{B}=\mathbf{A}^{-1}$, meaning $\mathbf{A B}=\mathbf{B A}=\mathbf{I}$. Must show two things: $\mathbf{B}^{\prime} \mathbf{A}^{\prime}=\mathbf{I}$ and $\mathbf{A}^{\prime} \mathbf{B}^{\prime}=\mathbf{I}$.

$$
\begin{aligned}
& \mathbf{A B}=\mathbf{I} \Rightarrow \mathbf{B}^{\prime} \mathbf{A}^{\prime}=\mathbf{I}^{\prime}=\mathbf{I} \\
& \mathbf{B A}=\mathbf{I} \Rightarrow \mathbf{A}^{\prime} \mathbf{B}^{\prime}=\mathbf{I}^{\prime}=\mathbf{I}
\end{aligned}
$$

## Extras

You may not know about these, but we may use them occasionally

- Trace
- Rank
- Partitioned matrices

## Trace of a square matrix

- Sum of diagonal elements
- Obvious: $\operatorname{tr}(\mathbf{A}+\mathbf{B})=\operatorname{tr}(\mathbf{A})+\operatorname{tr}(\mathbf{B})$
- Not obvious: $\operatorname{tr}(\mathbf{A B})=\operatorname{tr}(\mathbf{B A})$

## Rank

- Row rank is the number of linearly independent rows
- Column rank is the number of linearly independent columns
- Rank of a matrix is the minimum of row rank and column rank
- $\operatorname{rank}(\mathbf{A B})=\min (\operatorname{rank}(\mathbf{A}), \operatorname{rank}(\mathbf{B}))$

## Partitioned matrix

- A matrix of matrices

$$
\left[\begin{array}{c|c}
\mathrm{A} & \mathrm{~B} \\
\hline \mathrm{C} & \mathrm{D}
\end{array}\right]
$$

- Row by column (matrix) multiplication works, provided the matrices are the right sizes.

## Eigenvalues and eigenvectors

Let $\mathbf{A}=\left[a_{i, j}\right]$ be an $n \times n$ matrix, so that the following applies to square matrices. $\mathbf{A}$ is said to have an eigenvalue $\lambda$ and (non-zero) eigenvector $\mathbf{x}$ corresponding to $\lambda$ if

$$
\mathbf{A} \mathbf{x}=\lambda \mathbf{x}
$$

- Eigenvalues are the $\lambda$ values that solve the determinantal equation $|\mathbf{A}-\lambda \mathbf{I}|=0$.
- The determinant is the product of the eigenvalues:

$$
|\mathbf{A}|=\prod_{i=1}^{n} \lambda_{i}
$$

## Spectral decomposition of symmetric matrices

The Spectral decomposition theorem says that every square and symmetric matrix $\mathbf{A}=\left[a_{i, j}\right]$ may be written

$$
\mathbf{A}=\mathbf{C D C}^{\prime},
$$

where the columns of $\mathbf{C}$ (which may also be denoted $\mathbf{x}_{1}, \ldots, \mathbf{x}_{n}$ ) are the eigenvectors of $\mathbf{A}$, and the diagonal matrix $\mathbf{D}$ contains the corresponding eigenvalues.

$$
\mathbf{D}=\left[\begin{array}{cccc}
\lambda_{1} & 0 & \cdots & 0 \\
0 & \lambda_{2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \lambda_{n}
\end{array}\right]
$$

The eigenvectors may be chosen to be orthonormal, so that $\mathbf{C}$ is an orthogonal matrix. That is, $\mathbf{C C}^{\prime}=\mathbf{C}^{\prime} \mathbf{C}=\mathbf{I}$.

## Positive definite matrices

The $n \times n$ matrix $\mathbf{A}$ is said to be positive definite if

$$
\mathbf{y}^{\prime} \mathbf{A} \mathbf{y}>0
$$

for all $n \times 1$ vectors $\mathbf{y} \neq \mathbf{0}$. It is called non-negative definite (or sometimes positive semi-definite) if $\mathbf{y}^{\prime} \mathbf{A y} \geq 0$.

## Example: Show $\mathbf{X}^{\prime} \mathbf{X}$ non-negative definite

Let $\mathbf{X}$ be an $n \times p$ matrix of real constants and $\mathbf{y}$ be $p \times 1$. Then $\mathbf{Z}=\mathbf{X y}$ is $n \times 1$, and

$$
\begin{aligned}
& \mathbf{y}^{\prime}\left(\mathbf{X}^{\prime} \mathbf{X}\right) \mathbf{y} \\
= & (\mathbf{X y})^{\prime}(\mathbf{X y}) \\
= & \mathbf{Z}^{\prime} \mathbf{Z} \\
= & \sum_{i=1}^{n} Z_{i}^{2} \geq 0
\end{aligned}
$$

## Some properties of symmetric positive definite matrices

Variance-covariance matrices are often assumed positive definite.

For a symmetric matrix,

Positive definite
$\Downarrow$
All eigenvalues positive
$\Downarrow$
Inverse exists $\Leftrightarrow$ Columns (rows) linearly independent

If a real symmetric matrix is also non-negative definite, as a variance-covariance matrix must be, Inverse exists $\Rightarrow$ Positive definite

## Showing Positive definite $\Rightarrow$ Eigenvalues positive For example

Let $\mathbf{A}$ be square and symmetric as well as positive definite.

- Spectral decomposition says $\mathbf{A}=\mathbf{C D C}^{\prime}$.
- Using $\mathbf{y}^{\prime} \mathbf{A y}>0$, let $\mathbf{y}$ be an eigenvector, say the third one.
- Because eigenvectors are orthonormal,
$y^{\prime} \mathbf{A y}=y^{\prime} \mathbf{C D C}^{\prime} y$
$=\left(\begin{array}{lllll}0 & 0 & 1 & \cdots & 0\end{array}\right)\left(\begin{array}{cccc}\lambda_{1} & 0 & \cdots & 0 \\ 0 & \lambda_{2} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_{n}\end{array}\right)\left(\begin{array}{c}0 \\ 0 \\ 1 \\ \vdots \\ 0\end{array}\right)$
$=\lambda_{3}$
$>0$

## Inverse of a diagonal matrix

Suppose $\mathbf{D}=\left[d_{i, j}\right]$ is a diagonal matrix with non-zero diagonal elements. It is easy to verify that

$$
\left(\begin{array}{cccc}
d_{1,1} & 0 & \cdots & 0 \\
0 & d_{2,2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & d_{n, n}
\end{array}\right)\left(\begin{array}{cccc}
1 / d_{1,1} & 0 & \cdots & 0 \\
0 & 1 / d_{2,2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 1 / d_{n, n}
\end{array}\right)=\mathbf{I}
$$

And

$$
\left(\begin{array}{cccc}
1 / d_{1,1} & 0 & \cdots & 0 \\
0 & 1 / d_{2,2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 1 / d_{n, n}
\end{array}\right)\left(\begin{array}{cccc}
d_{1,1} & 0 & \cdots & 0 \\
0 & d_{2,2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & d_{n, n}
\end{array}\right)=\mathbf{I}
$$

## Showing Eigenvalues positive $\Rightarrow$ Inverse exists

 For a symmetric, positive definite matrixLet $\mathbf{A}$ be symmetric and positive definite. Then $\mathbf{A}=\mathbf{C D C}^{\prime}$ and its eigenvalues are positive.

Let $\mathbf{B}=\mathbf{C D}^{-1} \mathbf{C}^{\prime}$

Showing $\mathbf{B}=\mathbf{A}^{-1}$ :

$$
\begin{aligned}
\mathbf{A B} & =\mathbf{C D C}^{\prime} \mathbf{C D}^{-1} \mathbf{C}^{\prime}=\mathbf{I} \\
\mathbf{B A} & =\mathbf{C D}^{-1} \mathbf{C}^{\prime} \mathbf{C D C}^{\prime}=\mathbf{I}
\end{aligned}
$$

So

$$
\mathbf{A}^{-1}=\mathbf{C D}^{-1} \mathbf{C}^{\prime}
$$

## Square root matrices

For symmetric, non-negative definite matrices
Define

$$
\mathbf{D}^{1 / 2}=\left(\begin{array}{cccc}
\sqrt{\lambda_{1}} & 0 & \cdots & 0 \\
0 & \sqrt{\lambda_{2}} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \sqrt{\lambda_{n}}
\end{array}\right)
$$

So that
$\begin{aligned} \mathbf{D}^{1 / 2} \mathbf{D}^{1 / 2} & =\left(\begin{array}{cccc}\sqrt{\lambda_{1}} & 0 & \cdots & 0 \\ 0 & \sqrt{\lambda_{2}} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \sqrt{\lambda_{n}}\end{array}\right)\left(\begin{array}{cccc}\sqrt{\lambda_{1}} & 0 & \cdots & 0 \\ 0 & \sqrt{\lambda_{2}} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \sqrt{\lambda_{n}}\end{array}\right) \\ & =\left(\begin{array}{ccccc}\lambda_{1} & 0 & \cdots & 0 \\ 0 & \lambda_{2} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_{n}\end{array}\right)=\mathbf{D}\end{aligned}$

## For a non-negative definite, symmetric matrix A

Define

$$
\mathbf{A}^{1 / 2}=\mathbf{C D}^{1 / 2} \mathbf{C}^{\prime}
$$

So that

$$
\begin{aligned}
\mathbf{A}^{1 / 2} \mathbf{A}^{1 / 2} & =\mathbf{C D}^{1 / 2} \mathbf{C}^{\prime} \mathbf{C D}^{1 / 2} \mathbf{C}^{\prime} \\
& =\mathbf{C D}^{1 / 2} \mathbf{I} \mathbf{D}^{1 / 2} \mathbf{C}^{\prime} \\
& =\mathbf{C D}^{1 / 2} \mathbf{D}^{1 / 2} \mathbf{C}^{\prime} \\
& =\mathbf{C D C} \\
& =\mathbf{A}
\end{aligned}
$$

The square root of the inverse is the inverse of the square root

Let $\mathbf{A}$ be symmetric and positive definite, with $\mathbf{A}=\mathbf{C D C}^{\prime}$.
Let $\mathbf{B}=\mathbf{C D}^{-1 / 2} \mathbf{C}^{\prime}$. What is $\mathbf{D}^{-1 / 2}$ ?
Show $\mathbf{B}=\left(\mathbf{A}^{-1}\right)^{1 / 2}$

$$
\begin{aligned}
\mathbf{B B} & =\mathbf{C D}^{-1 / 2} \mathbf{C}^{\prime} \mathbf{C D}^{-1 / 2} \mathbf{C}^{\prime} \\
& =\mathbf{C D}^{-1} \mathbf{C}^{\prime}=\mathbf{A}^{-1}
\end{aligned}
$$

Show $\mathbf{B}=\left(\mathbf{A}^{1 / 2}\right)^{-1}$

Just write

$$
\begin{aligned}
\mathbf{A}^{1 / 2} \mathbf{B} & =\mathbf{C D}^{1 / 2} \mathbf{C}^{\prime} \mathbf{C D}^{-1 / 2} \mathbf{C}^{\prime}=\mathbf{I} \\
\mathbf{B A}^{1 / 2} & =\mathbf{C D}^{-1 / 2} \mathbf{C}^{\prime} \mathbf{C D}^{1 / 2} \mathbf{C}^{\prime}=\mathbf{I}
\end{aligned}
$$

$$
\mathbf{A}^{-1 / 2}=\mathbf{C D}^{-1 / 2} \mathbf{C}^{\prime}
$$

## Matrix calculation with R

```
> is.matrix(3) # Is the number 3 a 1x1 matrix?
[1] FALSE
```

> treecorr $=$ cor (trees) ; treecorr

|  | Girth | Height | Volume |
| :--- | ---: | ---: | ---: |
| Girth | 1.0000000 | 0.5192801 | 0.9671194 |
| Height | 0.5192801 | 1.0000000 | 0.5982497 |
| Volume | 0.9671194 | 0.5982497 | 1.0000000 |

> is.matrix(treecorr)
[1] TRUE

## Creating matrices

Bind rows into a matrix
> \# Bind rows of a matrix together
$>A=r b i n d(c(3,2,6,8)$,
$+\quad c(2,10,-7,4)$,
$+\quad \mathrm{c}(6,6,9,1) \quad$; A

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ | $[, 4]$ |
| :--- | ---: | ---: | ---: | ---: |
| $[1]$, | 3 | 2 | 6 | 8 |
| $[2]$, | 2 | 10 | -7 | 4 |
| $[3]$, | 6 | 6 | 9 | 1 |

> \# Transpose
$>\mathrm{t}$ (A)

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ |
| :--- | ---: | ---: | ---: |
| $[1]$, | 3 | 2 | 6 |
| $[2]$, | 2 | 10 | 6 |
| $[3]$, | 6 | -7 | 9 |
| $[4]$, | 8 | 4 | 1 |

## Matrix multiplication

Remember, $\mathbf{A}$ is $3 \times 4$
$>\# U=A A \prime(3 x 3), V=A^{\prime} A(4 \times 4)$
$>\mathrm{U}=\mathrm{A} \% * \% \mathrm{t}(\mathrm{A})$
$>\mathrm{V}=\mathrm{t}(\mathrm{A}) \% * \% \mathrm{~A} ; \mathrm{V}$

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ | $[, 4]$ |
| :--- | ---: | ---: | ---: | ---: |
| $[1]$, | 49 | 62 | 58 | 38 |
| $[2]$, | 62 | 140 | -4 | 62 |
| $[3]$, | 58 | -4 | 166 | 29 |
| $[4]$, | 38 | 62 | 29 | 81 |

## Determinants

> \# U = AA' (3x3), V = A'A (4x4)
$>$ \# So rank(V) cannot exceed 3 and $\operatorname{det}(V)=0$
$>\operatorname{det}(U) ; \operatorname{det}(V)$
[1] 1490273
[1] $-3.622862 \mathrm{e}-09$

Inverse of $\mathbf{U}$ exists, but inverse of $\mathbf{V}$ does not.

## Inverses

- The solve function is for solving systems of linear equations like $\mathbf{M x}=\mathbf{b}$.
- Just typing solve(M) gives $\mathbf{M}^{-1}$.
> solve(U)

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ |
| ---: | ---: | ---: | ---: |
| $[1]$, | 0.0173505123 | $-8.508508 \mathrm{e}-04$ | $-1.029342 \mathrm{e}-02$ |
| $[2]$, | -0.0008508508 | $5.997559 \mathrm{e}-03$ | $2.013054 \mathrm{e}-06$ |
| $[3]$, | -0.0102934160 | $2.013054 \mathrm{e}-06$ | $1.264265 \mathrm{e}-02$ |

> solve(V)

Error in solve.default(V) :
system is computationally singular: reciprocal condition number $=6.64193 e-18$

## Eigenvalues and eigenvectors

> eigen(U)
\$values
