# More Linear Algebra ${ }^{1}$ STA 431: Fall 2023 

[^0]
## Overview

(1) Things you already know
(2) Trace
(3) Spectral decomposition

4 Positive definite
(5) Extras
(6) R

## You already know about

- Matrices $\mathbf{A}=\left[a_{i j}\right]$
- Matrix addition and subtraction $\mathbf{A}+\mathbf{B}=\left[a_{i j}+b_{i j}\right]$
- Column vectors $\mathbf{v}=\left[v_{j}\right]$
- Scalar multiplication $a \mathbf{B}=\left[a b_{i j}\right]$
- Matrix multiplication $\mathbf{A B}=\left[\sum_{k} a_{i k} b_{k j}\right]$

In words: The $i, j$ element of $\mathbf{A B}$ is the inner product of row $i$ of $\mathbf{A}$ with column $j$ of $\mathbf{B}$.

- Inverse $\mathbf{A}^{-1} \mathbf{A}=\mathbf{A} \mathbf{A}^{-1}=\mathbf{I}$
- Transpose $\mathbf{A}^{\top}=\left[a_{j i}\right]$
- Symmetric matrices $\mathbf{A}=\mathbf{A}^{\top}$
- Determinants
- Linear independence

## Three mistakes that will get you a zero <br> Numbers are $1 \times 1$ matrices, but larger matrices are not just numbers.

You will get a zero if you

- Write $\mathbf{A B}=\mathbf{B A}$. It's not true in general.
- Write $\mathbf{A}^{-1}$ when $\mathbf{A}$ is not a square matrix. The inverse is not even defined.
- Represent the inverse of a matrix (even if it exists) by writing it in the denominator, like $\mathbf{a}^{\top} \mathbf{B}^{-1} \mathbf{a}=\frac{\mathbf{a}^{\top} \mathbf{a}}{\mathbf{B}}$. Matrices are not just numbers.

If you commit one of these crimes, the mark for the question (or part of a question, like 3c) is zero, regardless of what else you write.

## Half marks off, at least

You will lose at least half marks for writing a product like AB when the number of columns in $\mathbf{A}$ does not equal the number of rows in $\mathbf{B}$.

## Trace of a square matrix: Sum of the diagonal elements

$$
\operatorname{tr}(\mathbf{A})=\sum_{i=1}^{n} a_{i, i}
$$

- Obvious: $\operatorname{tr}(\mathbf{A}+\mathbf{B})=\operatorname{tr}(\mathbf{A})+\operatorname{tr}(\mathbf{B})$.
- Not obvious: $\operatorname{tr}(\mathbf{A B})=\operatorname{tr}(\mathbf{B A})$
- Even though $\mathbf{A B} \neq \mathbf{B A}$

## Example

Let $\mathbf{A}=\left(\begin{array}{rrr}2 & 1 & 0 \\ 5 & -4 & 3\end{array}\right)$ and $\mathbf{B}=\left(\begin{array}{rr}1 & 0 \\ 2 & 3 \\ -1 & 3\end{array}\right)$

$$
\begin{aligned}
\mathbf{A B} & =\left(\begin{array}{rr}
4 & 3 \\
-6 & -3
\end{array}\right) \\
\mathbf{B A} & =\left(\begin{array}{rrr}
2 & 1 & 0 \\
19 & -10 & 9 \\
13 & -13 & 9
\end{array}\right)
\end{aligned}
$$

And $\operatorname{tr}(\mathbf{A B})=\operatorname{tr}(\mathbf{B A})$.

## Eigenvalues and eigenvectors

Let $\mathbf{A}=\left[a_{i, j}\right]$ be a square matrix. $\mathbf{A}$ is said to have an eigenvalue $\lambda$ and eigenvector $\mathbf{x} \neq \mathbf{0}$ corresponding to $\lambda$ if

$$
\mathbf{A} \mathbf{x}=\lambda \mathbf{x}
$$

Recall

- Eigenvalues are the $\lambda$ values that solve the determinantal equation $|\mathbf{A}-\lambda \mathbf{I}|=0$.
- The determinant is the product of the eigenvalues: $|\mathbf{A}|=\prod_{i=1}^{n} \lambda_{i}$

## Spectral decomposition of symmetric matrices

The Spectral decomposition theorem says that every square and symmetric matrix $\mathbf{A}=\left[a_{i, j}\right]$ may be written

$$
\mathbf{A}=\mathbf{C D C}^{\top},
$$

where the columns of $\mathbf{C}$ (which may also be denoted $\mathbf{x}_{1}, \ldots, \mathbf{x}_{n}$ ) are the eigenvectors of $\mathbf{A}$, and the diagonal matrix $\mathbf{D}$ contains the corresponding eigenvalues.

$$
\mathbf{D}=\left(\begin{array}{cccc}
\lambda_{1} & 0 & \cdots & 0 \\
0 & \lambda_{2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \lambda_{n}
\end{array}\right)
$$

- If the elements of $\mathbf{A}$ are real, the eigenvalues are real.
- The eigenvectors may be chosen to be orthonormal, so that $\mathbf{C}$ is an orthogonal matrix. That is, $\mathbf{C C ^ { \top }}=\mathbf{C}^{\top} \mathbf{C}=\mathbf{I}$.

## Inverse of a diagonal matrix

Suppose the eigenvalues are all non-zero. Let

$$
\mathbf{D}^{-1}=\left(\begin{array}{cccc}
\frac{1}{\lambda_{1}} & 0 & \cdots & 0 \\
0 & \frac{1}{\lambda_{2}} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \frac{1}{\lambda_{n}}
\end{array}\right)
$$

It works because

$$
\left(\begin{array}{cccc}
\lambda_{1} & 0 & \cdots & 0 \\
0 & \lambda_{2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \lambda_{n}
\end{array}\right)\left(\begin{array}{cccc}
\frac{1}{\lambda_{1}} & 0 & \cdots & 0 \\
0 & \frac{1}{\lambda_{2}} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \frac{1}{\lambda_{n}}
\end{array}\right)=\mathbf{I}
$$

## Square root of a diagonal matrix

Suppose the eigenvalues are non-negative. Let

$$
\mathbf{D}^{1 / 2}=\left(\begin{array}{cccc}
\sqrt{\lambda_{1}} & 0 & \cdots & 0 \\
0 & \sqrt{\lambda_{2}} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & \sqrt{\lambda_{n}}
\end{array}\right)
$$

It works because
$\begin{aligned} \mathbf{D}^{1 / 2} \mathbf{D}^{1 / 2} & =\left(\begin{array}{cccc}\sqrt{\lambda_{1}} & 0 & \cdots & 0 \\ 0 & \sqrt{\lambda_{2}} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \sqrt{\lambda_{n}}\end{array}\right)\left(\begin{array}{cccc}\sqrt{\lambda_{1}} & 0 & \cdots & 0 \\ 0 & \sqrt{\lambda_{2}} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \sqrt{\lambda_{n}}\end{array}\right) \\ & =\left(\begin{array}{ccccc}\lambda_{1} & 0 & \cdots & 0 \\ 0 & \lambda_{2} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_{n}\end{array}\right)=\mathbf{D}\end{aligned}$

## Using $\mathbf{A}=\mathbf{C D C}^{\top}$

Where $\mathbf{A}$ is a symmetric matrix

$$
\begin{aligned}
\mathbf{A}^{-1} & =\mathbf{C D}^{-1} \mathbf{C}^{\top} \\
\mathbf{A}^{1 / 2} & =\mathbf{C D}^{1 / 2} \mathbf{C}^{\top} \\
\mathbf{A}^{-1 / 2} & =\mathbf{C D}^{-1 / 2} \mathbf{C}^{\top}
\end{aligned}
$$

## Positive definite matrices

The $n \times n$ matrix $\mathbf{A}$ is said to be positive definite if

$$
\mathbf{y}^{\top} \mathbf{A} \mathbf{y}>0
$$

for all $n \times 1$ vectors $\mathbf{y} \neq \mathbf{0}$.
It is called non-negative definite (or sometimes positive semi-definite) if $\mathbf{y}^{\top} \mathbf{A y} \geq 0$.

## Some properties of symmetric positive definite matrices

 Variance-covariance matrices are often assumed positive definite.For a symmetric matrix,

Positive definite
$\Downarrow$
All eigenvalues positive
$\Downarrow$
Inverse exists $\Leftrightarrow$ Columns (rows) linearly independent.

If a real symmetric matrix is also non-negative definite (as a variance-covariance matrix must be) Linear independence $\Rightarrow$ Positive definite.

## Extras

You may not know about these, and we may use them occasionally

- Rank
- Partitioned matrices

## Rank

- Row rank is the number of linearly independent rows.
- Column rank is the number of linearly independent columns.
- Rank of a matrix is the minimum of row rank and column rank.
- $\operatorname{rank}(\mathbf{A B})=\min (\operatorname{rank}(\mathbf{A}), \operatorname{rank}(\mathbf{B}))$.

## Partitioned matrix

- A matrix of matrices

$$
\left[\begin{array}{c|c}
\mathrm{A} & \mathrm{~B} \\
\hline \mathrm{C} & \mathrm{D}
\end{array}\right]
$$

- Row by column (matrix) multiplication works, provided the matrices are the right sizes.

## Matrix calculation with R

```
> is.matrix(3) # Is the number 3 a 1x1 matrix?
[1] FALSE
```

> treecorr $=$ cor (trees) ; treecorr

|  | Girth | Height | Volume |
| :--- | ---: | ---: | ---: |
| Girth | 1.0000000 | 0.5192801 | 0.9671194 |
| Height | 0.5192801 | 1.0000000 | 0.5982497 |
| Volume | 0.9671194 | 0.5982497 | 1.0000000 |

> is.matrix(treecorr)
[1] TRUE

## Creating matrices

Bind rows into a matrix
> \# Bind rows of a matrix together
$>A=r b i n d(c(3,2,6,8)$,
$+\quad c(2,10,-7,4)$,
$+\quad \mathrm{c}(6,6,9,1) \quad$; A

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ | $[, 4]$ |
| :--- | ---: | ---: | ---: | ---: |
| $[1]$, | 3 | 2 | 6 | 8 |
| $[2]$, | 2 | 10 | -7 | 4 |
| $[3]$, | 6 | 6 | 9 | 1 |

> \# Transpose
$>\mathrm{t}$ (A)

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ |
| :--- | ---: | ---: | ---: |
| $[1]$, | 3 | 2 | 6 |
| $[2]$, | 2 | 10 | 6 |
| $[3]$, | 6 | -7 | 9 |
| $[4]$, | 8 | 4 | 1 |

## Matrix multiplication

Remember, $\mathbf{A}$ is $3 \times 4$
$>\# U=A A^{\prime}(3 \times 3), V=A^{\prime} A(4 \times 4)$
$>\mathrm{U}=\mathrm{A} \% * \% \mathrm{t}(\mathrm{A})$
$>\mathrm{V}=\mathrm{t}(\mathrm{A}) \% * \% \mathrm{~A} ; \mathrm{V}$

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ | $[, 4]$ |
| :--- | ---: | ---: | ---: | ---: |
| $[1]$, | 49 | 62 | 58 | 38 |
| $[2]$, | 62 | 140 | -4 | 62 |
| $[3]$, | 58 | -4 | 166 | 29 |
| $[4]$, | 38 | 62 | 29 | 81 |

## Determinants

A is $3 \times 4$
$>$ \# U = A A' (3x3), V = A' A ( $4 \times 4$ )
> \# So rank(V) cannot exceed 3 and $\operatorname{det}(V)=0$
$>\operatorname{det}(U) ; \operatorname{det}(V)$
[1] 1490273
[1] $-3.622862 \mathrm{e}-09$

Inverse of $\mathbf{U}$ exists, but inverse of $\mathbf{V}$ does not.

## Inverses

- The solve function is for solving systems of linear equations like $\mathbf{M x}=\mathbf{b}$.
- Just typing solve(M) gives $\mathbf{M}^{-1}$.
> \# Recall U = A A' (3x3), V = A' A (4x4)
> solve(U)

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ |
| ---: | ---: | ---: | ---: |
| $[1]$, | 0.0173505123 | $-8.508508 \mathrm{e}-04$ | $-1.029342 \mathrm{e}-02$ |
| $[2]$, | -0.0008508508 | $5.997559 \mathrm{e}-03$ | $2.013054 \mathrm{e}-06$ |
| $[3]$, | -0.0102934160 | $2.013054 \mathrm{e}-06$ | $1.264265 \mathrm{e}-02$ |

> solve(V)

Error in solve.default(V) :
system is computationally singular: reciprocal condition
number $=6.64193 \mathrm{e}-18$

## Eigenvalues and eigenvectors

```
> # Recall U = A A' (3x3), V = A' A (4x4)
> eigen(U)
$values
[1] 234.01162 162.89294 39.09544
```

\$vectors

|  | $[, 1]$ | $[, 2]$ | $[, 3]$ |
| ---: | ---: | ---: | ---: |
| $[1]$, | -0.6025375 | 0.1592598 | 0.78203893 |
| $[2]$, | -0.2964610 | -0.9544379 | -0.03404605 |
| $[3]$, | -0.7409854 | 0.2523581 | -0.62229894 |

## V should have at least one zero eigenvalue

Because $\mathbf{A}$ is $3 \times 4, \mathbf{V}=\mathbf{A}^{\top} \mathbf{A}$, and the rank of a product is the minimum rank of the matrices.

```
> eigen(V)
```

\$values

$$
\text { [1] } 2.340116 \mathrm{e}+02 \quad 1.628929 \mathrm{e}+02 \quad 3.909544 \mathrm{e}+01 \quad-1.012719 \mathrm{e}-14
$$

\$vectors
